

Company - AreaSim

Country - Norway

Color theme - decide a color theme which match with this domain and specially for norwegiens

Add both lite mode and dark mode options

What is AreaSim?

- AreaSim provides end-to-end workspace intelligence that transforms how organizations optimize their physical spaces

What AreaSim try to achieve?

- Complete workspace intelligence
 - Current workspace analysis - Deep-dive analysis of your existing space utilization, cost-per-employee metrics, and efficiency patterns. Identify hidden inefficiencies and optimization opportunities.
 - New space discovery - Comprehensive market analysis to find the perfect new workspace that matches your requirements, budget, and growth projections.
 - Ongoing optimization - Continuous monitoring and optimization of your workspace efficiency, with regular reviews and adjustments to maximize value.
 - Implementation support - End-to-end support for workspace optimization implementation, including change management, team training, and performance monitoring.

What problem is AreaSim trying to solve?

- The Hidden costs of inefficient workspaces
 - 1. No efficiency analysis - Months of internal meetings and guesswork to understand your current workspace efficiency. No structured approach leads to missed optimization opportunities. (High Risk: Missed optimization opportunities)
 - 2. Suboptimal utilization - Paying for unused space or inefficient layouts. Lack of data-driven insights means you're not getting the most out of your real estate investment. (Medium Risk: Suboptimal workspace utilization)
 - 3. Cost analysis gaps - Incomplete understanding of true occupancy costs, hidden expenses, and potential savings. Budgeting becomes a guessing game. (High Risk: Financial losses from inefficiency)

- 4. Lack of implementation support - Great plans often fail at execution. Without expert support, translating optimization strategies into real-world changes is challenging. (Medium Risk: Costly post-implementation changes)

Here the main user group is tenant.

Tenant Profile: - Looking to extend their lease in one year - Discovered the site when looking for workplace optimisation solutions.

Project Vision - To empower organisations to design data driven, flexible and future ready workplaces by combining spatial intelligence, employee insights, and AI assisted decision making.

Expected Outcome - A production ready foundation that enables workplace analysis through floor plans, utilisation mapping, and surveys, delivering initial insights and a baseline workplace concept.

Competitor - <https://neowit.io/>

Also the client inspired by the illustrations in - <https://empireai.co/>

Client expectation - Even though this is an enterprise level webapp, users should not get that boring feeling. Instead users should feel like this is a very attractive and interesting platform to work on. At the same time they should be able to get things done.

User flow => Signup through email -> Verify email -> Create password -> Setup your first project (Project name, building name, category, location, add floor names) -> Add lease parameters (Total area SqFt. , Annual rent cost, Common area cost, Target headcount) -> Upload floor layout (Here user upload one floor plan related to the mentioned building and map with relevant floor name. User can upload floor plan in jpg, png or pdf format) -> Verify the uploaded floor plan image -> Show what we are going to do (**Great! You're all set!** In order to give you advice on your space utilization, it's important for us to get specific details about each floor. We just need you to: Identify rooms, Identify zones, Get participant count from each room, Conduct survey. Then we have the "Continue to guide" button) -> Canvas guide (Here we guide the user how to use canvas, the main features, by using the first floor plan. This guide is similar to www.gather.town first user guide. But here we don't have meetings like Gather. In this) -> Canvas (This is the 1st floor plan of the 1st project/building)

Main features of canvas guide:

- Mark rooms - Select a room from the dropdown and use the drawing tool to mark the rooms on the floor plan
- Grouping tool - You identified the rooms, now you can group the rooms and make the zones using grouping tool
- Mark zones - If just one room is one zone, use the drawing tool instead of grouping tool.

- Detailed view - By clicking detailed view button, you can see the details of the floor including zones, room details. Also you can add zones there.
- Conduct survey - By clicking conduct survey button, you get access to the survey templates we build for you. You can send it out to your employees.
- Navigation - Navigation helps you to switch between different floors of the building. Also you can click on the logo to navigate to the main page where you can see all the projects/buildings.
- Score - Score helps you to identify how many number of rooms you counted, how many zones you identified and how many survey responses were collected.

Here in AreaSim user can draw on the flow plan using a pen (which is similar to a figma pen) and mark a room. Once they mark the room we show a modal next to the room. This modal contains “Room name”, “Description: You can now count the room capacity”, “Start room counting button” and “View details button”.

Once the user clicks on the “Start room counting” button, we navigate them to a different page which is dedicated to counting. In this page the user can see the room name, set count, and also it captures who counted when and at what time. The counting in the same room can happen 3 times a day continuously for a week. Here the client want us to design this screen similar to <https://empireai.co/> .

User have to do the room counting in every room.. Then we allow them to group a set of rooms and mark it as a zone. This also can be done using the pen (which is similar to a figma pen).

In addition, users should be able to send out a survey form to all the employees in that floor/ the building. This gathers data from users how satisfied they are with the current setup.

When doing these things, the user should be able to get a gamification feeling. On the top right corner of the canvas, the user should be able to see a score. Ex: 0/10 rooms were identified, 0 zones were counted , 0 survey responses were collected.

Once users complete all that I mentioned above, we show a modal saying that now you can move to the next step which is “Room Program” (Expert advice based on the earlier gathered data). But there's a subscription fee. To get into the room program page, users have to click on the pay now button and make a subscription payment.

The most important thing is the Client expectation (Even though this is an enterprise level webapp, users should not get that boring feeling. Instead users should feel like this is a very attractive and interesting platform to work on. At the same time they should be able to get things done. Get inspired by <https://neowit.io/> and <https://empireai.co/>)
